

30 day rolling average analysis

```
library(ggplot2)
library(mgcv)
```

Loading required package: nlme

This is mgcv 1.9-1. For overview type 'help("mgcv-package")'.

```
library(dplyr)
```

Attaching package: 'dplyr'

The following object is masked from 'package:nlme':

`collapse`

The following objects are masked from 'package:stats':

`filter, lag`

The following objects are masked from 'package:base':

`intersect, setdiff, setequal, union`

```
df.ts.series2 <- read.csv("df.ts.series2.csv") %>%
  filter(!species == "Pseudotsuga menziesii")
num.cols <- c("twd", "pr", "at", "ws", "dp", "sr", "lr", "day.of.year")
```

```

rolling_avg_cols <- colnames(df.ts.series2)[grep("_rolling30", colnames(df.ts.series2))]

rolling_avg_cols <- rolling_avg_cols[!rolling_avg_cols == "day.of.year_rolling30"]

print_time_ycol <- function(ycol){
  ggplot(
    df.ts.series2,
    aes(x = cum.time.days, color = year, group = interaction(year, tree.id))) +
    geom_line(aes_string(y = ycol)) +
    #geom_point(aes(color = year), size = 1)+
    facet_wrap(~species) +
    theme(legend.position='bottom')
}

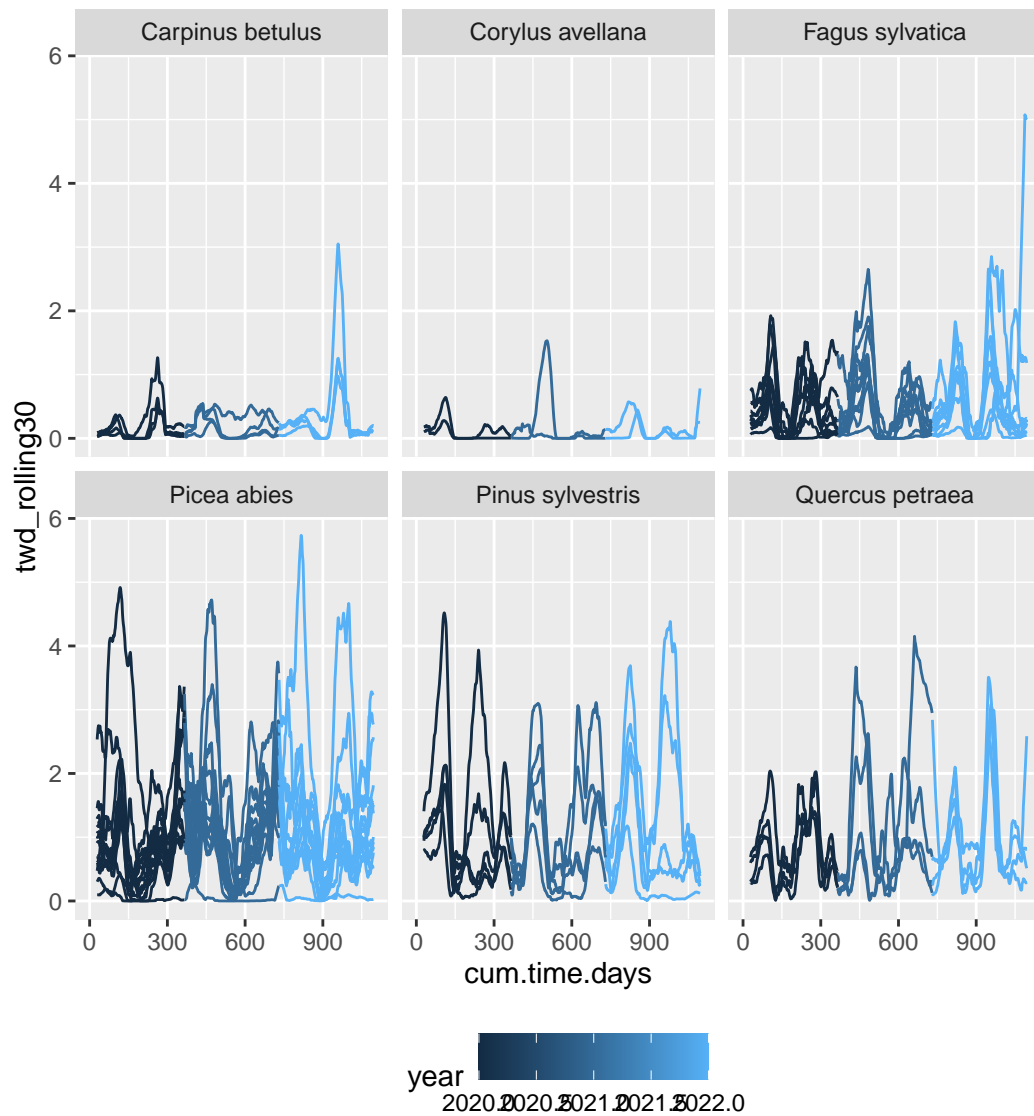

lapply(rolling_avg_cols, print_time_ycol)

```

Warning: `aes_string()` was deprecated in ggplot2 3.0.0.
 i Please use tidy evaluation idioms with `aes()`.
 i See also `vignette("ggplot2-in-packages")` for more information.

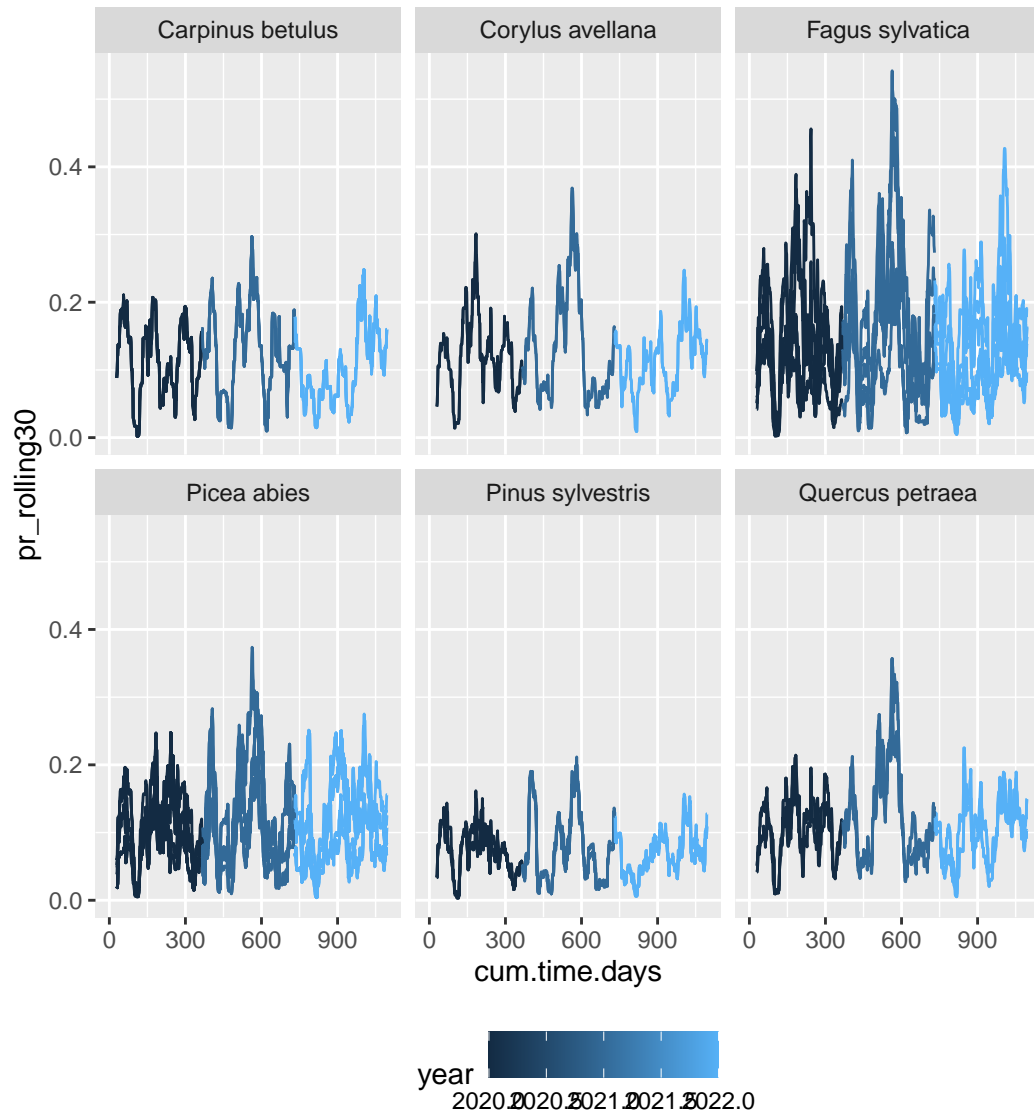

```
plot(gam_model, pages = 1, se = TRUE)
```

General structure of each plot:

- X-axis: The values of the predictor variable (e.g., `pr_rolling30`, `at_rolling30`, etc.).
- Y-axis: The smooth effect $f(x)$ of the predictor on the response. This is not the raw coefficient, but the estimated non-linear transformation.
- Black line: Estimated smooth function.
- Dashed lines: Confidence intervals (usually 95%).

Individual variable interpretations:

`pr_rolling30` (precipitation?): Effect is fairly flat \rightarrow very little to no influence on the response in this range.

`at_rolling30` (air temperature?): U-shaped effect \rightarrow lower values are associated with higher outcomes, middle values suppress it, and higher values raise it again.

`ws_rolling30` (wind speed?): Slightly declining influence, but very flat \rightarrow weak or no effect overall.

`dp_rolling30` (dew point?): Positive effect when very low, then peaks and slightly drops \rightarrow might indicate an optimal dew point range.

`sr_rolling30` (solar radiation?): Flat and near-zero \rightarrow suggests solar radiation has little effect on the response.

`lr_rolling30` (longwave radiation?): Slight decline \rightarrow higher values may slightly decrease the response.
